

Can You Spot the Role Slag Plays in Health Care?

Slag is a useful co-product of the iron and steelmaking process, well known for its value in removing pollutants from waterways and for its role in building construction and roadways. But did you know that its usefulness extends to such places as operating rooms? Slag is at the root of brown glass, used for medicine bottles, and mineral wool used as fire-resistant insulation and acoustic tiles. Phoenix Services leads the

way to a healthier planet, helping manufacturers reduce their carbon footprint, enhancing biodiversity through water purification systems, and conserving natural resources through recycling.

PHOENIX SERVICES^{LLC}

World Class Experience. World Class Service.
